# Open Source Ecology

*Fractal Circuitry
for
OSE System Wide
Information Flows*

How it Works:
Worker anywhere
sends data sends it to the "cloud."
Each personal message is a "ping"
sent by coded and colored id tag
so source/destination/and archival tags
are clear.

Pings are distributed live to the world
but coded to reach ganglion or work
nodes where a "Leader" receives them and
collates and codes each, sending on "packets"
of relevant data that are coded for attention to
Core Team specialists which can be viewed by
anyone in the Core sector.

Core Team specialists get the packet directly
and can re-sort and send on to Marcin
(or any other relevant team member)
any important data, decisions, and
archival documents.

Searches for data can be
created to search any color code,
any number code or location/destination code
at any time by anyone in the cloud.
